

GC0154 – Interconnector ramping

22nd March 2023

Online Meeting via Teams

Workgroup objective

Jess Rivalland – ESO Code Administrator

CBA update

Adrian Palmer – Baringa

Deep dive on IC proposed options

Lijia Qiu - Nationalgrid Ventures

TSO ramp management

- Ramping Rate Change service similar to current tripartite agreements
 - ESO requests the service if needed
 - Opposite TSO to accept / reject the services based on their system condition
 - Once the request has been accepted, a new reference program to be generated
 - Fee structure for TSO and IC similar to current arrangement (compensate TSO impact rather than profit making)
 - ESO to consider automatic despatch / confirmation
 - Consider early TSO communication/decision whenever possible
 - To be implemented for all existing and future ICs
- Maintain the current ramping rate limit

Complimentary response / ramping market

- ESO to utilise Ramping Rate Change service as required in the first instance
- Consider redesigning /utilising the response market with the aim to facilitate an overall more dynamic future GB network
 - ESO to enact more response reserve, should the response cost to be more cost-effective
- A IC ramping rate limit to reflect GB operating security limit after ramping rate change service and response market being considered.

AOB and Next Steps

Jess Rivalland – ESO Code Administrator
