# Final Annual Load Factors for 2017/18 Generation TNUoS Charges

---

This information paper contains the Final Annual Load Factors (ALFs) that National Grid will use in the calculation of Generation TNUoS charges from April 2017.

**25 January 2017**  
**V2**

### **Disclaimer**

This report is published without prejudice and whilst every effort has been made to ensure the accuracy of the Draft Annual Load Factors, National Grid reserves the right to alter Annual Load Factors where the methodology is found to have been incorrectly applied.

## 1 Introduction

Annual Load Factors (ALFs) are an important component used in the calculation of a generator's share of Transmission Network Use of System (TNUoS) tariffs.

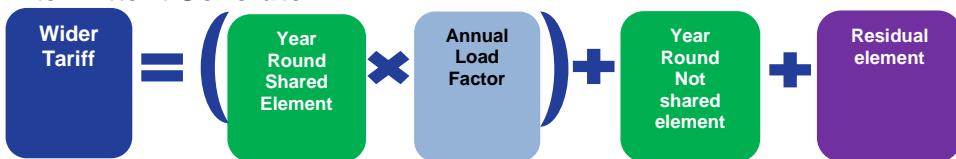

Following Project TransmiT, the Authority's significant code review of electricity transmission charging arrangements, National Grid raised CUSC Modification Proposal 213. The modification made changes to the TNUoS charging methodology to better reflect the costs imposed by different types of generators on the electricity transmission network. The Authority directed the implementation of CMP213 Working Group Alternative 2 (WACM2) on 25 July 2014. Further details of the modification can be found on the CUSC Modifications area of National Grid's website<sup>1</sup>.

Under the new methodology there are still 27 generation zones but each zone now has four tariffs rather than just one. A Generator's liability is dependent upon its type of generation. Generation powered by intermittent sources (e.g. wind, wave, tidal and solar) do not pay the peak security element whereas conventionally powered generation (e.g. fossil, nuclear, biomass, storage and hydro) do. Liability for each tariff component is shown below:

### **Conventional Generator**

### **Intermittent Generator**

Each generator has an ALF based on its performance over the last five years. Where a new plant does not have at least three complete years of charging history then the generic ALF for that technology is used.

We are happy to provide support and advice on the derivation of ALFs to our customers. However the data used to derive the ALFs is very large so we are only able to provide support to generators for stations in their own portfolios.

---

## **2 Changes from the December 2016 Draft ALFs**

On 9 December 2016, we published the draft ALFs to be used in the calculation of the 2017/18 Final Tariffs. On 22 December 2016, we published our Draft TNUoS tariffs for 2017/18. Appendix D of the report contained the draft generator-specific and generic ALFs for 2017/18.

The values in this document supersede those in the Draft tariffs and will be used in the Final Tariffs to be published later this month. Some minor amendments have been made to the draft ALFs published in December.

Barking power station and Kings Lynn A power station have requested to be added into the list. They were not included due to not holding TEC during 2015/16.

Strathy North and South has also been added to the list. Their ALF is 43.05%.

Carrington power station's ALF was miscalculated as having a full year of data from 2015/16 instead of a partial year. This has changed the specific ALF from 25.95% to 38.86%.

West Of Duddon Sands Offshore Wind Farm's ALF has been amended due to a change in the BMU ID part-way through the 2015/16 year. The new ALF is 45.59%.

Finally, the generic coal ALF has been impacted by the closure of Longannet, Rugeley B and Ferrybridge B. These units will be removed from the ALF calculation list and so reduces the number of coal plants used to calculate the generic coal ALF. The generic ALF has changed from 57.3594% to 56.9749%.

### 3 Approach

ALFs have been calculated using data from 2011/12 to 2015/16, these being the five most recent complete charging years. For each charging year 2011/12 to 2015/16 a Yearly Load Factor has been calculated using the higher of Metered Output (MO), Final Physical Notification (FPN) or zero in each half hour settlement period, divided by the sum of Transmission Entry Capacity (TEC), Short Term TEC (STTEC) and Limited Duration TEC (LDTEC) applicable in the same half hour.

All calculations are in local time, i.e. clock change days have 46 or 50 half hour settlement periods rather than the usual 48. TEC, STTEC and LDTEC are daily products so changes occur at midnight.

The ALF is the average of three Yearly Load Factors. Where five complete years are available, the highest and lowest Yearly Load Factors are removed and the average is calculated using the remaining three. Where four complete years are available only the lowest is removed. If fewer than three Yearly Load Factors are available, the generic ALF is used to either complete a year where a generator commissioned mid-year or to provide additional years.

For new generators, the station specific load factor is calculated from the date of first output, and not the earliest date on which TEC is held. Generic ALF data is used for every half hourly period before first output to form a ‘partial’ year of ALF data for that power station.

ALFs are calculated at station level, so where a station has multiple Balancing Mechanism Units (BMU) representing generating units, station demand or trading site demand, the MO and FPN will be the aggregate of these.

For cascade hydro schemes the ALF is calculated at scheme level, so the MO and FPN will be the aggregate of the BMU associated with the scheme. The scheme ALF is applied to each station in the scheme.

Generic ALFs are calculated from the ten most recently commissioned generators from each technology where available. Commissioning years have been taken from the Digest of United Kingdom Energy Statistics Table 5.11<sup>2</sup> but commissioning dates within the five charging years under consideration have been checked against Metered Output and Final Physical Notification data to determine the exact date.

## 4 Annual Load Factors

Table 1 shows Annual Load Factors (ALF) for generators operating between 2011/12 and 2015/16. New power stations should refer to Table 2 for the generic ALF for their fuel type.

Where a station is listed as a Generic Station it has been used in the calculation of the Generic Annual Load Factor for its technology.

## 5 Generic Annual Load Factors

Table 2 shows Generic ALFs for each generation technology. Generic ALFs are used to calculate Yearly Load Factors of power stations with less than three complete charging years of data and Annual Load Factors of generators commissioning during 2016/17 or 2017/18.

**Table 2**

Technology	Generic ALF	Intermittent/ Conventional	Carbon/ Low Carbon
Gas_Oil	0.1645%	Conventional	Carbon
Pumped_Storage	10.5704%	Conventional	Carbon
Tidal	18.9000%	Intermittent	Low Carbon
Biomass	26.8847%	Conventional	Carbon
Wave	31.0000%	Intermittent	Low Carbon
Onshore_Wind	37.8084%	Intermittent	Low Carbon
CCGT_CHP	38.9336%	Conventional	Carbon
Hydro	44.3345%	Conventional	Low Carbon
Offshore_Wind	47.9931%	Intermittent	Low Carbon
Coal	56.9749%	Conventional	Carbon
Nuclear	75.6256%	Conventional	Low Carbon

## **6 Next Steps**

The ALFs in this document will be included in the annual Statement of Use of System Charges effective 1 April 2016. If you have queries on how they were calculated please contact Tom Selby or the team email box using the contact details on page two.
